

# TUFF

MADE IN AUSTRALIA

## SAFETY HARNESS/SAFETY LINE INSTRUCTIONS:

- A. Adjust to fit the wearer as tightly as possible. When tight push one keeper as close as possible to seating buckle and the other to free end of harness.
- B. The waste should hook on to a strong anchorage point at all times.

### CAUTION:

- The anchorage point used should be capable of withstanding a minimum load of 12 kN. Where attachment is made to running safety lines, the load at the end of the span will be considerably higher.
  - C. The safety harness and line should be kept clean, dry and free from oil or grease. Wash in clean fresh water after use.
  - D. The safety harness and line should frequently be inspected for signs of deterioration.
  - E. The safety harness and line should be replaced if they have been subjected to a severe load.
  - F. It is intended to wear a safety harness and line in conjunction with a HTE Jacket. Users are advised to be trained together to insure that one does not interfere with the function of the other, and in particular that in use the line is not likely to tear the fire jacket.
- This Safety Harness/Safety Line has been manufactured and tested to meet the approved Aust. Standards Association No. 2227.
